AHOP — Defense FAQ (One-Page)

AgilityCare Health Operations Platform (AHOP)
Repository: https://github.com/jhewhome/ahop-snipe-it
Live demo: https://ahop.jhewhome.xyz/login (`clinicadmin` / `demo1234`)

---

1. What if our AI / analytics doesn't work perfectly?

Our **Clinical Analytics** module uses **rule-based decision support**, not a custom-trained machine learning model. Services such as patient risk scoring, lab trend analysis, and equipment maintenance scoring apply **transparent rules** (e.g., overdue maintenance, lab flags, visit history).

Defense answer: The goal is to demonstrate **integration of analytics into clinical workflow**, not to claim medical-grade AI accuracy. Outputs are **decision-support aids**; licensed staff retain clinical judgment. Limitations are documented: simplified rules, demo data, no external AI API dependency.

---

2. Can we use pre-trained models or APIs instead of training our own?

Yes — that is a valid production approach (OpenAI, Vertex AI, Hugging Face, SageMaker).

Defense answer: We chose **local rule-based analytics** so the system runs on our **Google Cloud VM** without API keys, GPU, or recurring AI service costs. Future work can replace or augment rules with cloud AI while keeping the same UI and data flow.

---

3. How much of the system must work for the demo?

Minimum — core clinical journey (must work live)

Step	Module	Demo account
Login (RBAC)	`/login`	`clinicadmin`, `reception`, `physician`
Patient register / search	Patients	`reception`
Check-in / appointment	Reception → Check-In	`reception`
OPD documentation	OPD → Queue	`physician`
Lab order → result	Lab Orders	`physician` → `labtech`
Billing	Billing Invoices	`clinicadmin`
Operations dashboard	Dashboard	`clinicadmin`

Password (after seed): `demo1234`

Also demonstrable (integration & requirements)

Topic	How we show it
Module integration	Patient → OPD → lab → billing on one record
Clinical Analytics ("AI")	Clinical Analytics: risk panel, lab trends, equipment scores
Polyglot persistence	Design: MySQL (core) + PostgreSQL (clinical) via dual-database mode; **live demo uses single MySQL** on GCP for simplicity
Cloud deployment	GCP VM + GitHub sync + PDF documentation
Security (RBAC)	Different roles see different menus/actions

---

4. Quick demo script (~3 minutes)

1. **Reception** — Check-in or register patient.
2. **Physician** — OPD queue → document visit → create lab order → complete visit.
3. **Lab** — Enter result.
4. **Admin** — Billing (invoice/payment) → Dashboard → **Clinical Analytics**.

---

5. Other likely panel questions

Question	Short answer
Is it really AI?	**Clinical decision support** with rule-based scoring; labeled "AI Insights" in UI; honest scope for capstone.
Polyglot persistence?	**Supported in code** (optional PostgreSQL clinical DB); **demo = one MySQL/MariaDB** on GCP.
Cloud vs local?	**Both:** localhost (XAMPP) for development; **GCP** for live defense demo.
What if cloud fails?	Local backup, GitHub source, PDF docs, screenshots.
Security?	RBAC (AHOP roles), sessions, audit logs, scheduled `ahop:backup`.
Data migration?	Demo seed data (`ahop:seed-all`); spreadsheet import = future work.

---

6. Documented limitations (state proactively)

- Analytics is **rule-based**, not clinically validated ML.
- Demo uses **seeded patients**, not full legacy migration.
- Live demo URL: **https://ahop.jhewhome.xyz** (HTTPS via Let's Encrypt).
- Appointment **SMS** not implemented (email reminders optional).
